Chapter 6

A Minimal Book Example

6.1 About

This is a *sample* book written in **Markdown**. You can use anything that Pandoc’s Markdown supports; for example, a math equation $a^2 + b^2 = c^2$.

6.1.1 Usage

Each **bookdown** chapter is an .Rmd file, and each .Rmd file can contain one (and only one) chapter. A chapter *must* start with a first-level heading: # A good chapter, and can contain one (and only one) first-level heading.

Use second-level and higher headings within chapters like: ## A short section or ### An even shorter section.

The `index.Rmd` file is required, and is also your first book chapter. It will be the homepage when you render the book.

6.1.2 Render book

You can render the HTML version of this example book without changing anything:

1. Find the **Build** pane in the RStudio IDE, and
2. Click on **Build Book**, then select your output format, or select “All formats” if you’d like to use multiple formats from the same book source files.

Or build the book from the R console:

```
bookdown::render_book()
```

To render this example to PDF as a `bookdown::pdf_book`, you’ll need to install XeLaTeX. You are recommended to install TinyTeX (which includes XeLaTeX): <https://yihui.org/tinytex/>.

6.1.3 Preview book

As you work, you may start a local server to live preview this HTML book. This preview will update as you edit the book when you save individual .Rmd files. You can start the server in a work session by using the RStudio add-in “Preview book”, or from the R console:

```
bookdown::serve_book()
```

6.2 Hello bookdown

All chapters start with a first-level heading followed by your chapter title, like the line above. There should be only one first-level heading (#) per .Rmd file.

6.2.1 A section

All chapter sections start with a second-level (##) or higher heading followed by your section title, like the sections above and below here. You can have as many as you want within a chapter.

An unnumbered section

Chapters and sections are numbered by default. To un-number a heading, add a {.unnumbered} or the shorter {-} at the end of the heading, like in this section.

6.3 Cross-references

Cross-references make it easier for your readers to find and link to elements in your book.

6.3.1 Chapters and sub-chapters

There are two steps to cross-reference any heading:

1. Label the heading: # Hello world {#nice-label}.
 - Leave the label off if you like the automated heading generated based on your heading title: for example, # Hello world = # Hello world {#hello-world}.
 - To label an un-numbered heading, use: # Hello world {-#nice-label} or {# Hello world .unnumbered}.
2. Next, reference the labeled heading anywhere in the text using \@ref(nice-label); for example, please see Chapter 6.3.
 - If you prefer text as the link instead of a numbered reference use: [any text you want can go here](#).

6.3.2 Captioned figures and tables

Figures and tables *with captions* can also be cross-referenced from elsewhere in your book using \@ref(fig:chunk-label) and \@ref(tab:chunk-label), respectively.

See Figure 6.1.

```
par(mar = c(4, 4, .1, .1))
plot(pressure, type = 'b', pch = 19)
```

Don't miss Table 6.1.

```
knitr::kable(
  head(pressure, 10), caption = 'Here is a nice table!',
  booktabs = TRUE
)
```

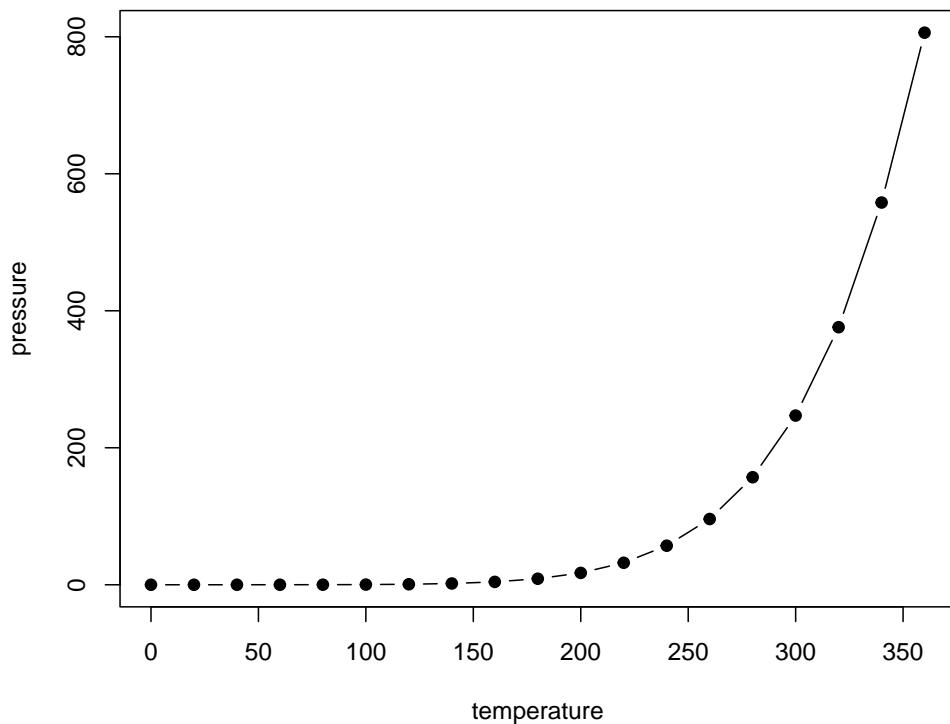

Figure 6.1: Here is a nice figure!

Table 6.1: Here is a nice table!

| temperature | pressure |
|-------------|----------|
| 0 | 0.0002 |
| 20 | 0.0012 |
| 40 | 0.0060 |
| 60 | 0.0300 |
| 80 | 0.0900 |
| 100 | 0.2700 |
| 120 | 0.7500 |
| 140 | 1.8500 |
| 160 | 4.2000 |
| 180 | 8.8000 |

6.4 Parts

You can add parts to organize one or more book chapters together. Parts can be inserted at the top of an .Rmd file, before the first-level chapter heading in that same file.

Add a numbered part: `# (PART) Act one {-} (followed by # A chapter)`

Add an unnumbered part: `# (PART*) Act one {-} (followed by # A chapter)`

Add an appendix as a special kind of un-numbered part: `# (APPENDIX) Other stuff {-} (followed by # A chapter)`. Chapters in an appendix are prepended with letters instead of numbers.

6.5 Footnotes and citations

6.5.1 Footnotes

Footnotes are put inside the square brackets after a caret `^[]`. Like this one ¹.

6.5.2 Citations

Reference items in your bibliography file(s) using `@key`.

For example, we are using the `bookdown` package¹ (check out the last code chunk in index.Rmd to see how this citation key was added) in this sample book, which was built on top of R Markdown and `knitr`² (this citation was added manually in an external file book.bib). Note that the `.bib` files need to be listed in the index.Rmd with the YAML `bibliography` key.

The RStudio Visual Markdown Editor can also make it easier to insert citations: <https://rstudio.github.io/visual-markdown-editing/#/citations>

6.6 Blocks

6.6.1 Equations

Here is an equation.

$$f(k) = \binom{n}{k} p^k (1-p)^{n-k} \quad (6.1)$$

You may refer to using `\@ref(eq:binom)`, like see Equation (6.1).

6.6.2 Theorems and proofs

Labeled theorems can be referenced in text using `\@ref(thm:tri)`, for example, check out this smart theorem 6.1.

Theorem 6.1. *For a right triangle, if c denotes the length of the hypotenuse and a and b denote the lengths of the other two sides, we have*

$$a^2 + b^2 = c^2$$

Read more here <https://bookdown.org/yihui/bookdown/markdown-extensions-by-bookdown.html>.

¹This is a footnote.

6.6.3 Callout blocks

The R Markdown Cookbook provides more help on how to use custom blocks to design your own callouts: <https://bookdown.org/yihui/rmarkdown-cookbook/custom-blocks.html>

6.7 Sharing your book

6.7.1 Publishing

HTML books can be published online, see: <https://bookdown.org/yihui/bookdown/publishing.html>

6.7.2 404 pages

By default, users will be directed to a 404 page if they try to access a webpage that cannot be found. If you'd like to customize your 404 page instead of using the default, you may add either a `_404.Rmd` or `_404.md` file to your project root and use code and/or Markdown syntax.

6.7.3 Metadata for sharing

Bookdown HTML books will provide HTML metadata for social sharing on platforms like Twitter, Facebook, and LinkedIn, using information you provide in the `index.Rmd` YAML. To setup, set the `url` for your book and the path to your `cover-image` file. Your book's `title` and `description` are also used.

This `gitbook` uses the same social sharing data across all chapters in your book- all links shared will look the same.

Specify your book's source repository on GitHub using the `edit` key under the configuration options in the `_output.yml` file, which allows users to suggest an edit by linking to a chapter's source file.

Read more about the features of this output format here:

<https://pkgs.rstudio.com/bookdown/reference/gitbook.html>

Or use:

```
?bookdown::gitbook
```

Chapter 9

partition

$$\begin{aligned} \{A_i\}_{i \in I} = \{A_i | i \in I\} \text{ is a partition of a set } A \\ \Leftrightarrow \begin{cases} \forall i \in I (A_i \neq \emptyset) \\ A = \bigcup_{i \in I} A_i \\ \forall i, j \in I (i \neq j \Rightarrow A_i \cap A_j = \emptyset) \end{cases} \end{aligned}$$

Chapter 10

equivalence class

C is an equivalence class of a on A

$$\Leftrightarrow [a]_{\sim} = C = \left\{ x \left| \begin{array}{l} a \in A \\ x \in A \\ x \sim a \\ \sim \text{ is an equivalence relation over } A \times A = A^2 \end{array} \right. \right\} \subseteq A \neq \emptyset$$
$$\Leftrightarrow [a] = [a]_{\sim} = \left\{ x \left| \begin{array}{l} a \in A \\ x \in A \\ x \sim a \\ \sim \text{ is an equivalence relation on } A \end{array} \right. \right\} \subseteq A \neq \emptyset$$
$$\Rightarrow [a]_{\sim} = \{x | x \sim a\} \subseteq A \neq \emptyset$$

where the definition of **equivalence relation** can be found in 11.

Chapter 11

equivalence relation

等價關係 equivalence relation

R is an equivalence relation over $A \times B$

$$\Leftrightarrow \left\{ \begin{array}{l} R = \sim = \{\langle x, y \rangle | x \sim y\} \subseteq A \times B \\ \vdots \end{array} \right. \quad (\text{e}) \text{ equivalence 等價}$$

$$\Leftrightarrow \left\{ \begin{array}{ll} R = \{\langle x, y \rangle | xRy\} \subseteq A \times B & (R) \text{ relation} \\ \forall \langle x, y \rangle \in R (xRx) & (r) \text{ reflexive} \\ \forall \langle x, y \rangle \in R (xRy \Rightarrow yRx) & (s) \text{ symmetric} \\ \forall \langle x, y \rangle, \langle y, z \rangle \in R \left(\begin{cases} xRy \\ yRz \end{cases} \Rightarrow xRz \right) & (t) \text{ transitive} \end{array} \right. \Leftrightarrow \left\{ \begin{array}{ll} R = \{\langle x, y \rangle | xRy\} \subseteq A \times B & \text{關係} \\ \forall \langle x, y \rangle \in R (\langle x, x \rangle \in R) & \text{自反} \\ \forall \langle x, y \rangle \in R (\langle y, x \rangle \in R) & \text{對稱} \\ \forall \langle x, y \rangle, \langle y, z \rangle \in R (\langle x, z \rangle \in R) & \text{遞移} \end{array} \right.$$

It turns out that you can simply put the `\usetikzlibrary{...}` command directly before the `\begin{tikzpicture}` and everything works fine :)

Not so common is `\pgfplotsset{compat=1.5}`. A statement like this should always be used in order to (a) benefit from a more or less recent feature set and (b) avoid changes to your picture if you recompile it with a later version of pgfplots.

13.4.7.2 addplot+

What does addplot+ do exactly?

<https://tex.stackexchange.com/questions/275959/what-does-addplot-do-exactly>

<https://tikz.dev/pgfplots/reference-addplot#/addplot+>

Every `\addplot` directive receives a pre-defined style (line color, marker style etc) through a pre-defined cycle list that is automatically chosen depending on the index of the current `\addplot` instruction. If you want to add some of your styles manually (like I want red colour instead of blue, say), you can add them through options to `\addplot` like `\addplot[<your options>]`. Now the question is whether you want your own style (`your options`) to be appended to or replace one of these cycle lists assigned. This is decided by the `+` sign. If you use `\addplot+ [<your options>]`, your style is appended to and by `\addplot[<your options>]`, your options will replace the assigned cycle list.

The “solution” is to use **matplotlib 3.6**, but I guess in nixpkgs a single version is used at a time. The last working upgrade is from 0911608 I guess (I tried using virtualenv + pip + nix-ld + export LD_LIBRARY_PATH="LD_LIBRARYPATH:NIX_LD_LIBRARY_PATH")

random variable

X

sample has randomness

probability function

$$P_x(E) \in [0, 1]$$

event = subset of sample space

E

input event with output probability in 0 to 1

$$P_x : \{E_i\}_{i \in I} \rightarrow [0, 1]$$

target of interest

- probability function

but events are hard to be listed or enumerated

$$X : \{\omega_i\}_{i \in I} \rightarrow \mathbb{R}$$

CDF = cumulative distribution function

$$F_X(x) = P_x((-\infty, x]) = P_x(X \leq x)$$

real function is much easier to be operable, there is differentiation or difference operation target of interest

- CDF = cumulative distribution function
- probability function

target of interest

- $P_x(\cdot)$ PF = probability function
 - $f_x(x) = P_x(X = x)$ PMF = probability mass function
 - $f_x(x) = \frac{d}{dx}P_x(X \leq x)$ PDF = probability density function
- $F_x(x)$ CDF = cumulative distribution function^[15.1.2.1]
- $M_x(\xi)$ MGF = moment generating function^[15.1.2.7.1]
- $\varphi_x(\xi)$ CF = characteristic function^[15.1.2.7.2]

$$\begin{array}{ccccccc} X & \sim & F_x(x) & \xleftrightarrow{\text{FToC}} & f_x(x) & \leftrightarrow & P_x \\ \text{inversion formula : } & \downarrow & \forall \xi \approx 0 [M_x(\xi) \in \mathbb{R}] \wedge & & \uparrow \downarrow & \searrow \nearrow & \leftarrow \rho \wedge \text{supp}(f_x) \text{ is bounded} \\ & \varphi_x(\xi) & \xleftrightarrow{} & M_x(\xi) & \rightarrow & & \{\mu_n | n \in \mathbb{N}\} \end{array}$$

In population,

$$X \sim F_x(x)$$

by sampling,

$$X_1, \dots, X_i, \dots, X_n = X_i \sim F_x(x)$$

or

$$X_1, \dots, X_i, \dots, X_n = X_i \stackrel{\text{i.i.d.}}{\sim} F_x(x)$$

i.i.d. = independently identically distributed

and inference back

parametrically

$$\hat{X} \sim \hat{F}_x(x) = \hat{F}_x(x|\theta)$$

or nonparametrically

$$\hat{X} \sim \hat{F}_x(x)$$

inference is function of samples, or called random function, to estimate unknown parameters

$$\hat{\Theta} \leftarrow (X_1, \dots, X_i, \dots, X_n) = T(X_1, \dots, X_n) = T(\dots, X_i, \dots) = T(X_i)$$

corresponding CDF for inference or estimation function of sampling random variables

$$T(X_1, \dots, X_n) = T \sim F_T(t)$$

wish to be unbiased and consistent

$$\begin{cases} E(\hat{\Theta}) = \theta \Leftrightarrow E(\hat{\Theta}) - \theta = 0 & \text{unbiasedness} \\ V(\hat{\Theta}) = 0 & \text{consistency} \end{cases}$$

unbiasedness usually harder than consistency, thus usually first considered consistency.
modeling or parameterizing with unknown parameter θ

$$F_X(x) \stackrel{M}{=} F_X(x|\theta) = F_X(x;\theta)$$

parameterization is to reduce unknown parameters from infinite ones to finite ones
e.g. for normally distributed data

$$f_X(x) \stackrel{M}{=} f_X(x|\theta) = \frac{e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}}{\sqrt{2\pi\sigma^2}} = f_X(x|\mu, \sigma^2) = f_X(x|\mu, \sigma)$$

the price of parameterization is guess wrong model.

multiple hypothesis testing

How to control the family-wise error rate?

Ideally,

FWER = family-wise error rate

$$\begin{aligned}
\alpha &= P \left(\overbrace{H_0^1 \cup \dots \cup H_0^m}^{} \middle| H_0^1 \cap \dots \cap H_0^m \right) = P(\text{reject any } H_0^i \mid \text{any } H_0^j \text{ is true}) \\
&= P \left(\bigcup_{i=1}^m \overbrace{H_0^i}^{} \middle| \bigcap_{j=1}^m H_0^j \right) = 1 - P \left(\bigcup_{i=1}^m \overbrace{H_0^i}^{} \middle| \bigcap_{j=1}^m H_0^j \right) \\
&= 1 - P \left(\bigcap_{i=1}^m \overbrace{H_0^i}^{} \middle| \bigcap_{j=1}^m H_0^j \right) = 1 - P \left(\text{not to reject any } H_0^i \middle| \bigcap_{j=1}^m H_0^j \right) \\
&\stackrel{H_0^j \text{ pairwise independent}}{=} 1 - \prod_{i=1}^m P \left(\overbrace{H_0^i}^{} \middle| \bigcap_{j=1}^m H_0^j \right) = 1 - \prod_{i=1}^m \left(1 - P \left(\overbrace{H_0^i}^{} \middle| \bigcap_{j=1}^m H_0^j \right) \right) \\
&\stackrel{\forall i, j \left[P \left(\overbrace{H_0^i}^{} \middle| \bigcap_{j=1}^m H_0^j \right) = \alpha_0 \right]}{=} 1 - \prod_{i=1}^m (1 - \alpha_0) = 1 - (1 - \alpha_0)^m \\
\alpha &= 1 - (1 - \alpha_0)^m \\
\alpha_0 &= 1 - (1 - \alpha)^{\frac{1}{m}} = 1 - \sqrt[m]{1 - \alpha} \\

But condition H_0^j pairwise independent is too strong.

Practically,

$$\begin{aligned}

\text{let } \forall i, j \left[P \left(\overbrace{H_0^i}^{} \middle| \bigcap_{j=1}^m H_0^j \right) = \alpha_0 \right] &\Rightarrow \sum_{i=1}^m P \left(\overbrace{H_0^i}^{} \middle| \bigcap_{j=1}^m H_0^j \right) = \sum_{i=1}^m \alpha_0 = m\alpha_0 \Rightarrow \alpha_0 = \frac{\alpha}{m} \\
&\Downarrow \\

3. inversion theorem or inversion formula

For $a < b$,

$$\begin{aligned} & \lim_{T \rightarrow \infty} \frac{1}{2\pi} \int_{-T}^{+T} \frac{e^{-ita} - e^{-itb}}{it} \varphi_x(t) dt \\ &= P(a < X < b) + \frac{1}{2} [P(X = a) + P(X = b)] \end{aligned}$$

i.e. $\varphi_x(\xi)$ determines $F_x(x)$.

$$\begin{array}{ccccccc} X & \sim & F_x(x) & \leftrightarrow & f_x(x) & & \\ \uparrow & & \forall \xi \approx 0 [M_x(\xi) \in \mathbb{R}] \wedge & \uparrow \downarrow & \searrow \nearrow & \leftrightarrow \rho \wedge \text{supp}(f_x) \text{ is bounded} \\ \varphi_x(\xi) & & \Leftrightarrow & M_x(\xi) & \rightarrow & & \{\mu_n | n \in \mathbb{N}\} \end{array}$$

$$\begin{aligned} & (\epsilon^2 - 1)(A'^2 + B'^2)\alpha - 2\epsilon^2(A'^2\alpha + A'B'\varphi + A'C') \\ &= (-(\epsilon^2 + 1)A'^2 + (\epsilon^2 - 1)B'^2)\alpha - 2\epsilon^2(A'B'\varphi + A'C') \\ &= (-(\epsilon^2 + 1)A'^2 + (\epsilon^2 - 1)B'^2)\alpha - 2\epsilon^2(A'B'\varphi + A'C') \end{aligned}$$

Can the above be more simplified?

$$\begin{aligned} \overline{FF'}^2 &= (\alpha - \chi)^2 + (\varphi - \psi)^2 \\ &= (\alpha - (\alpha - \epsilon AD))^2 + (\varphi - (\varphi - \epsilon BD))^2 \\ &= (\epsilon D)^2 (A^2 + B^2) \\ &= (\epsilon D)^2 \end{aligned}$$

$$(r \cos \theta)^2 + (r \sin \theta)^2 = [\epsilon (r \cos \theta + p)]^2$$

$$r^2 =$$

$$r = \pm \epsilon (r \cos \theta + p)$$

$$= \pm (r \epsilon \cos \theta + \epsilon p)$$

$$r (1 \mp \epsilon \cos \theta) = \epsilon p$$

$$r = \frac{\epsilon p}{1 \mp \epsilon \cos \theta}$$

$r = \frac{\epsilon p}{1 - \epsilon \cos \theta}$ will not cross $L = x + p = 0$ on graphs, so maybe it is a more correct solution

$$r = \frac{\epsilon p}{1 - \epsilon \cos \theta}$$

Matplotlib / matplotlib

<https://pbpython.com/effective-matplotlib.html>

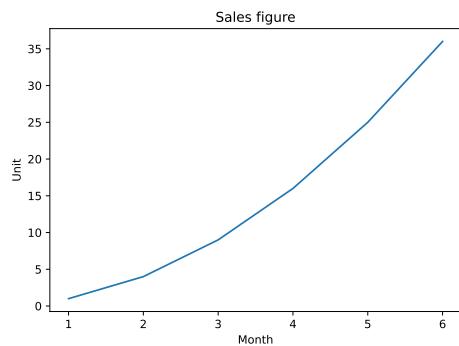

<https://tex.stackexchange.com/questions/84847/can-i-use-webp-images-in-latex>

You probably need to convert the image to png.

27.1.1 funcitonal API

```
import matplotlib.pyplot as plt

a1 = list(range(1, 7)) # [1, 2, 3, 4,
↪ 5, 6]
a2 = [1, 4, 9, 16, 25, 36]
plt.title('Sales figure')
plt.xlabel('Month')
plt.ylabel('Unit')
plt.plot(a1, a2) # this doesn't
↪ actually show the plot.
# plt.show() This is automatically
↪ called for Jupyter notebook.
```

To plot a scatterplot, call `scatter()` instead of `plot()`.

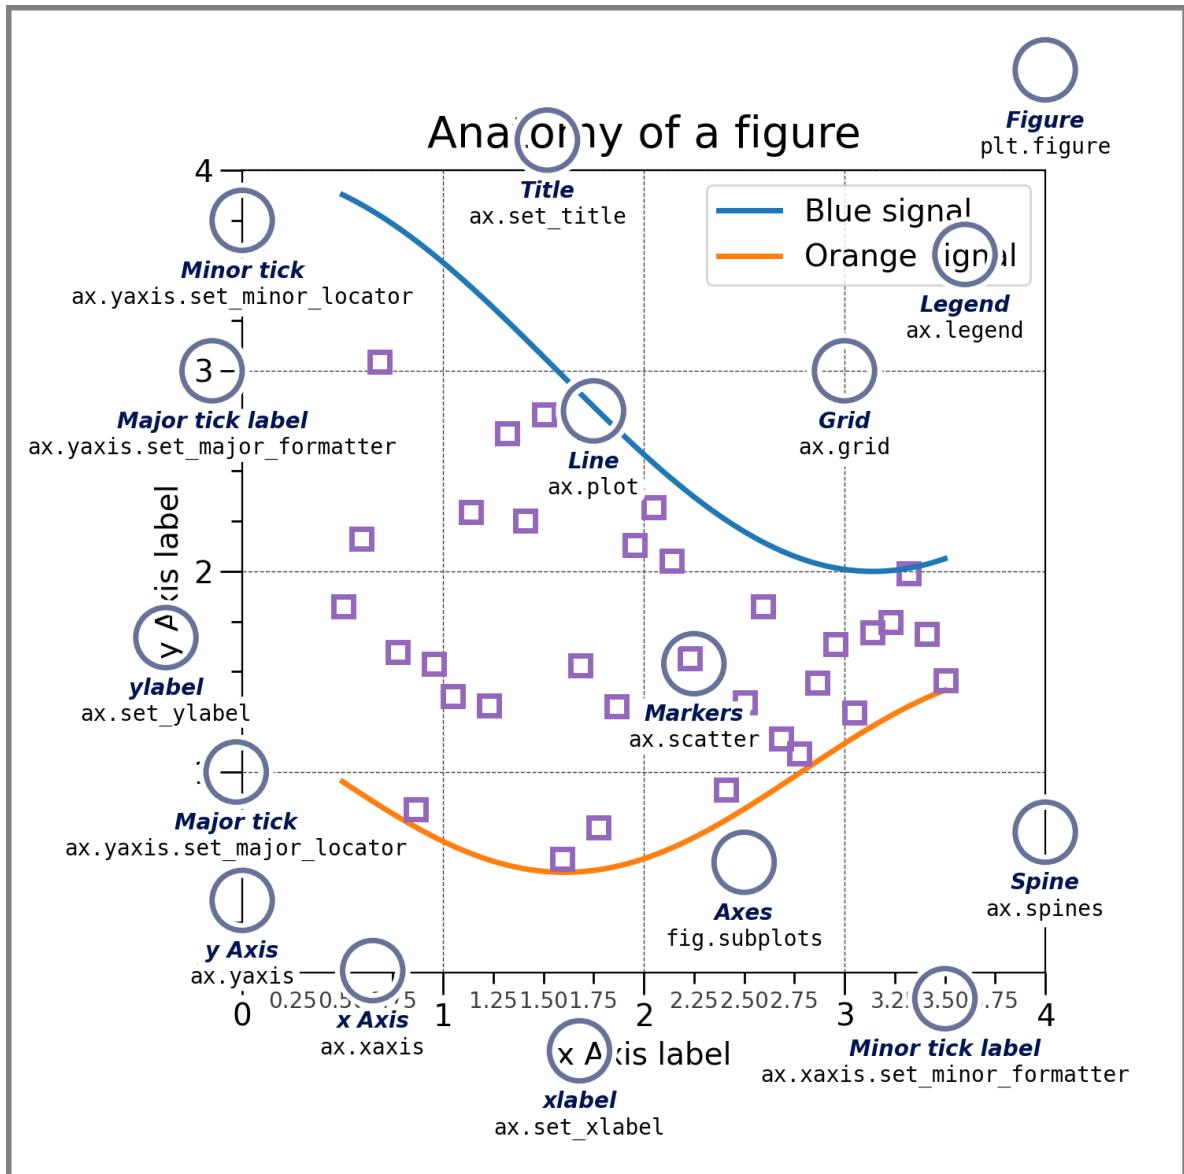

Figure 27.1: matplotlib figure anatomy

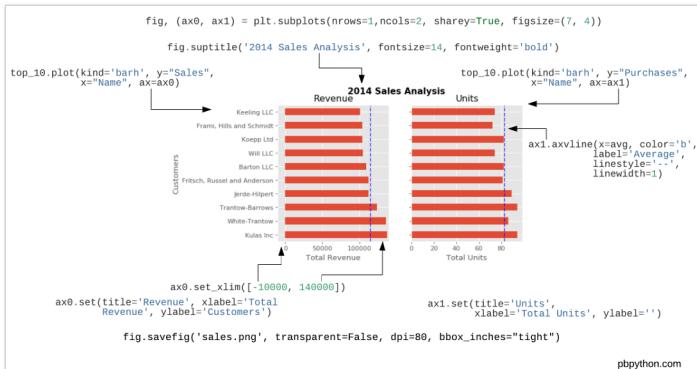

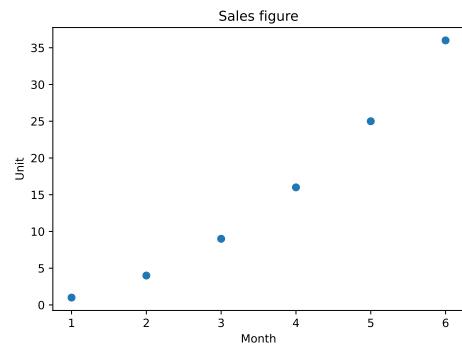

Figure 27.2: matplotlib subplot anatomy

```

import matplotlib.pyplot as plt

a1 = list(range(1, 7)) # [1, 2, 3, 4,
↪ 5, 6]
a2 = [1, 4, 9, 16, 25, 36]
plt.title('Sales figure')
plt.xlabel('Month')
plt.ylabel('Unit')
plt.scatter(a1, a2) # instead of
↪ plot.plot(), use scatter() to show
↪ scatter plot

```

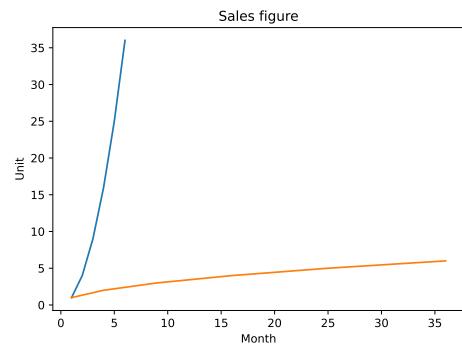

```

import matplotlib.pyplot as plt

a1 = list(range(1, 7)) # [1, 2, 3, 4,
↪ 5, 6]
a2 = [1, 4, 9, 16, 25, 36]
plt.title('Sales figure')
plt.xlabel('Month')
plt.ylabel('Unit')
plt.plot(a1, a2)
plt.plot(a2, a1)

```

The behavior of the functional API is stateful. What's stateful? An example is when you read a text file. When you `open()` a text file to read, the library read the next line every time you call `readline()`. It remembers where you left off, despite the fact that you do not give it the position to read from. This behavior of the library is called **stateful**. The way we've used Matplotlib is also **stateful**. And everytime, `plot.show()` is called (and it automatically gets called on cell ends), some state about plots is reset. We can see that here:

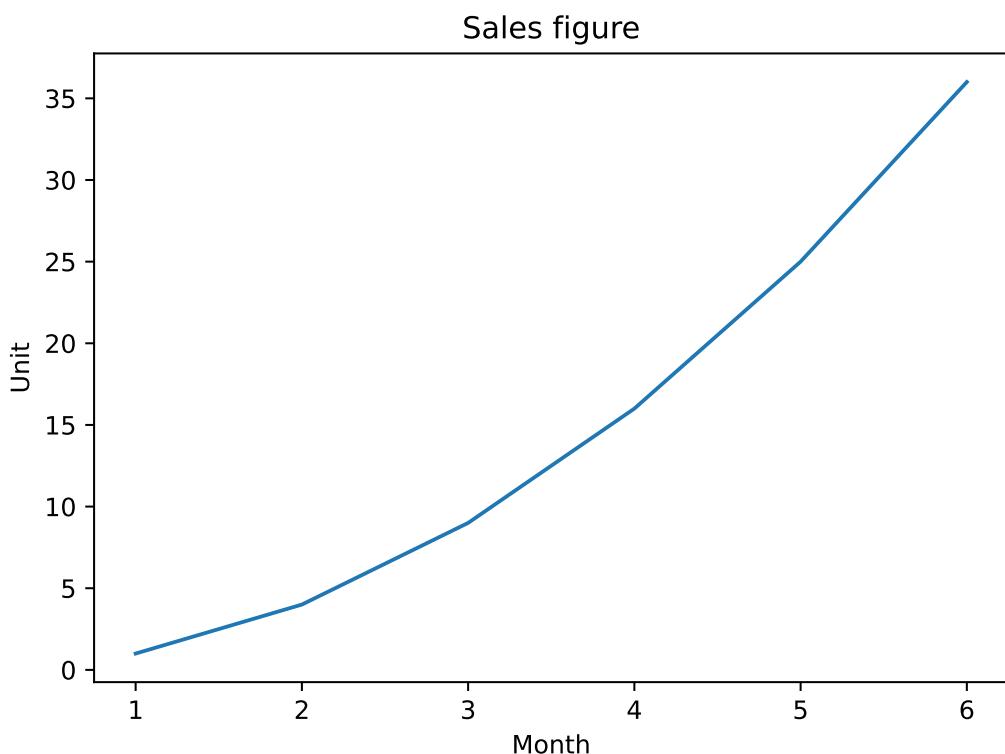

```

import matplotlib.pyplot as plt

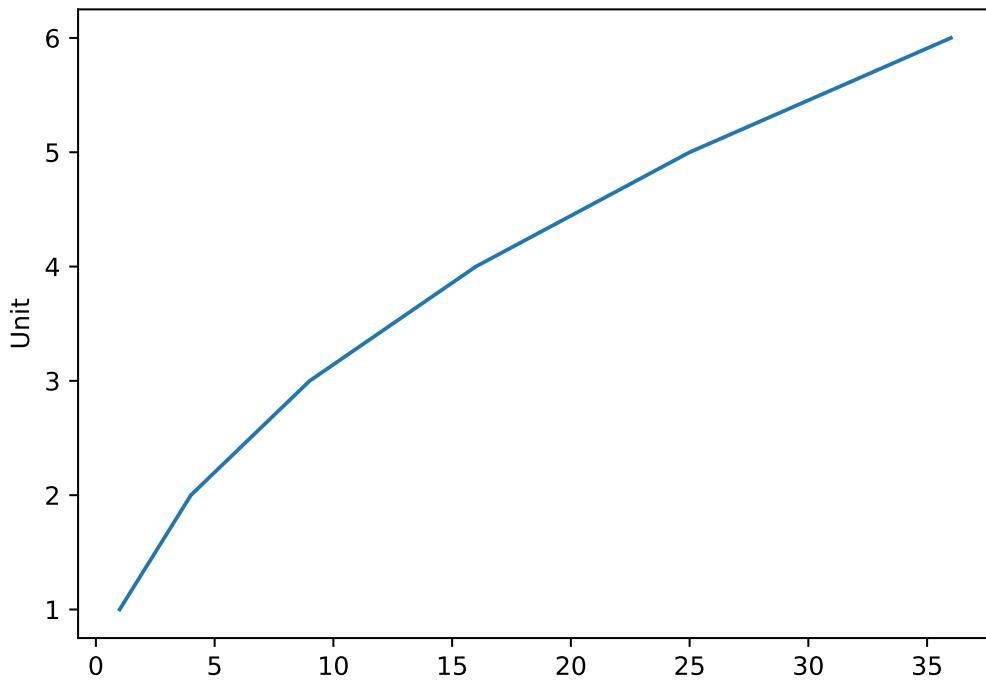

a1 = list(range(1, 7)) # [1, 2, 3, 4, 5, 6]

```

```
a2 = [1, 4, 9, 16, 25, 36]
plt.title('Sales figure')
plt.xlabel('Month')
plt.ylabel('Unit')
plt.plot(a1, a2)
```

```
plt.plot(a2, a1)
plt.ylabel('Unit')
```

It makes two graphs instead of one. Also note that `ylabel()` was called after `plot()`, and it is still shown before `plot.show()` but Sales Figure plot title and other labels don't show up on this graph. Because every time `plot.show()` is called, things are reset. This is a **stateful API** we're using. The functional APIs are used when you plot Matplotlib by calling on `pyplot` module level API (module level functions).

27.1.2 object-oriented API

In object-oriented API, we're getting two type of objects. One is `Figure`, the other one is `Axes`. `Figure` is the *canvas* of the plot. In English, axes is the plural form of axis. We're talking about the axis in x axis and y axis. Since one `plot` consists of both axis, in Matplotlib the object that represents one plot is called `Axes`. Since it's an object. We'll call it "a" axes.

```
import matplotlib.pyplot as plt

a1 = list(range(1, 7)) # [1, 2, 3, 4, 5, 6]
a2 = [1, 4, 9, 16, 25, 36]
fig = plt.figure()
print("fig is of type:", type(fig))

## fig is of type: <class 'matplotlib.figure.Figure'>
ax1 = fig.add_axes([0, 0, 1, 1]) # [left, bottom, width, height]
print("ax1 is of type:", type(ax1))

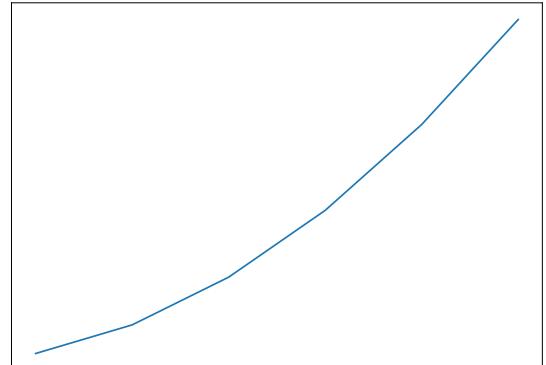

## ax1 is of type: <class 'matplotlib.axes._axes.Axes'>
```

```
# ax1.plot(a1, a2)
```

1. Call `figure()` to get a Figure type
2. Call `add_axes()` to get a `ax1` type `ax1 = fig.add_axes([0, 0, 1, 1]) # [left, bottom, width, height]`
 - The list given to `add_axes()` is the rectangular region of where to show the plot:
 - Bottom left corner at $x=0, y=0$, width and height of both 1, 1

```
import matplotlib.pyplot as plt

a1 = list(range(1, 7)) # [1, 2, 3, 4,
↪ 5, 6]
a2 = [1, 4, 9, 16, 25, 36]
fig = plt.figure()
# print("fig is of type:", type(fig))
ax1 = fig.add_axes([0, 0, 1, 1]) #
↪ [left, bottom, width, height]
# print("ax1 is of type:", type(ax1))
ax1.plot(a1, a2)
```

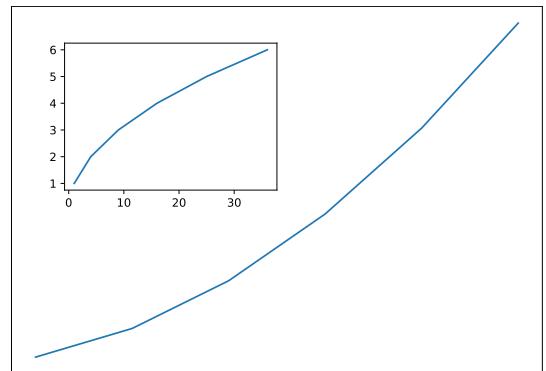

```

import matplotlib.pyplot as plt

a1 = list(range(1, 7)) # [1, 2, 3, 4,
↪ 5, 6]
a2 = [1, 4, 9, 16, 25, 36]
fig = plt.figure()
ax1 = fig.add_axes([0, 0, 1, 1])
ax1.plot(a1, a2)

                 style='time',
                 size='size')
```

- Legend is covering up the graph, it's getting out of hand. Let's tune the range of x
- `sns.scatterplot()` actually returns something that resembles Matplotlib axis. So we use a Matplotlib axis function:

```
ax = sns.scatterplot(...)
```

<https://stackoverflow.com/questions/26597116/seaborn-plots-not-showing-up>

```
import matplotlib.pyplot as plt
import seaborn as sns

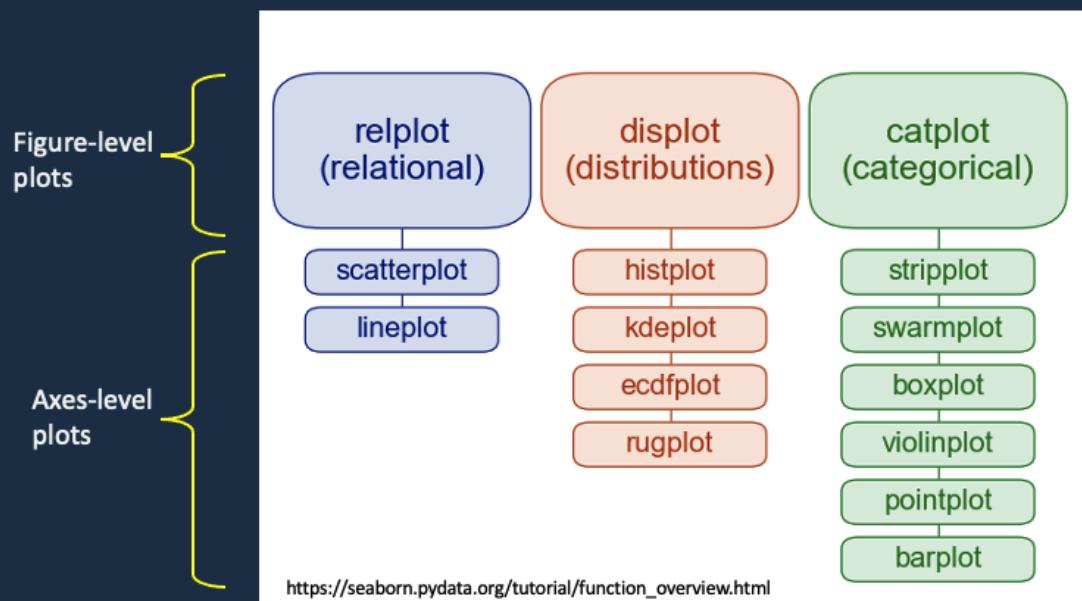

tips = sns.load_dataset("tips")
ax = sns.scatterplot(data=tips,
                     x='total_bill',
                     y='tip',
                     hue='smoker',
                     style='time',
                     size='size')
ax.set_xlim((0, 70))
# alternatively:
# ax.set(xlim=(0, 70))
plt.show()
```

27.1.3.3 axis-level plot and figure-level plot

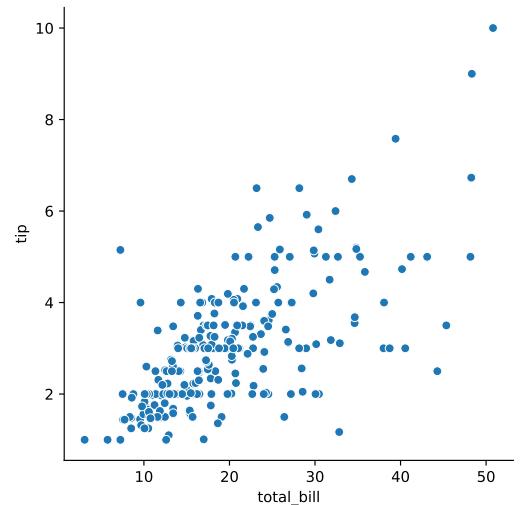

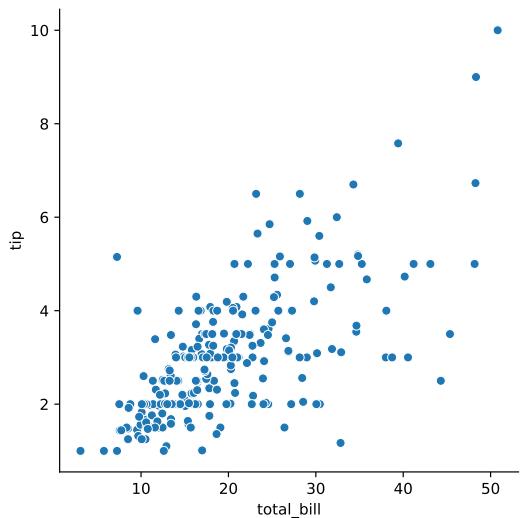

```
sns.replot
```

Three main type of Seaborn plots

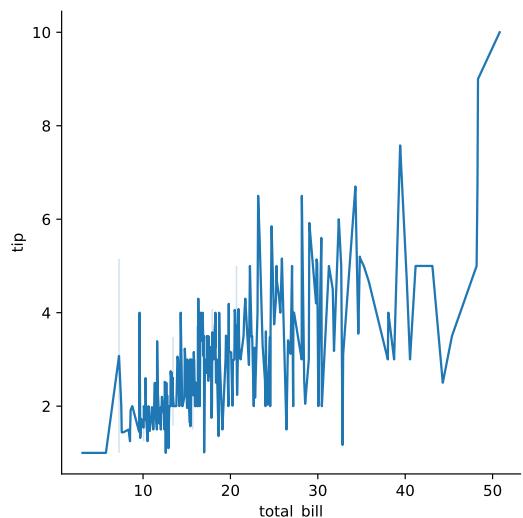

Yes, that correspond to Matplotlib's concept of figure and axes

Figure 27.4: seaborn plot type

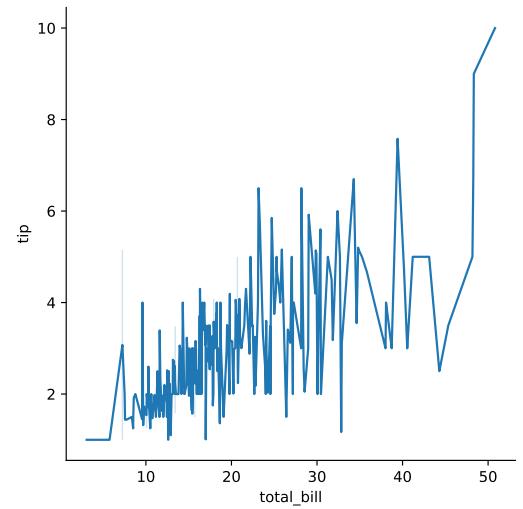

```
import seaborn as sns

tips = sns.load_dataset("tips")
sns.relplot(kind='scatter',
            data=tips,
            x='total_bill',
            y='tip')
```

```
import seaborn as sns

tips = sns.load_dataset("tips")
sns.relplot(kind='line',
            data=tips,
            x='total_bill',
            y='tip')
```

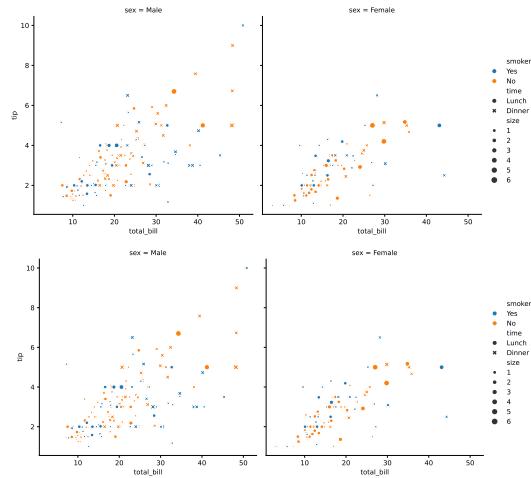

With figure-level plot, we can draw more than one plot (one `axes`).

Here we specify that different `sex` be on different column by specifying `col=sex`.

`col=sex`

```
import seaborn as sns

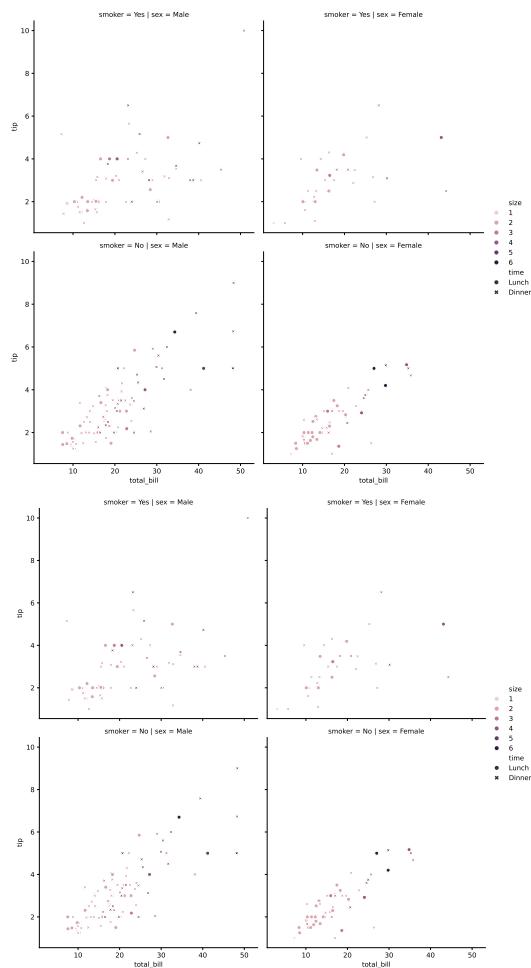

tips = sns.load_dataset("tips")
sns.relplot(kind='scatter',
            data=tips,
            x='total_bill',
            y='tip',
            hue='smoker',
            style='time',
            size='size',
            col='sex')
```

```
col=sex row=smoker
```

```
import seaborn as sns

tips = sns.load_dataset("tips")
sns.relplot(kind='scatter',
            data=tips,
            x='total_bill',
            y='tip',
            style='time',
            hue='size',
            row='smoker',
            col='sex')
```

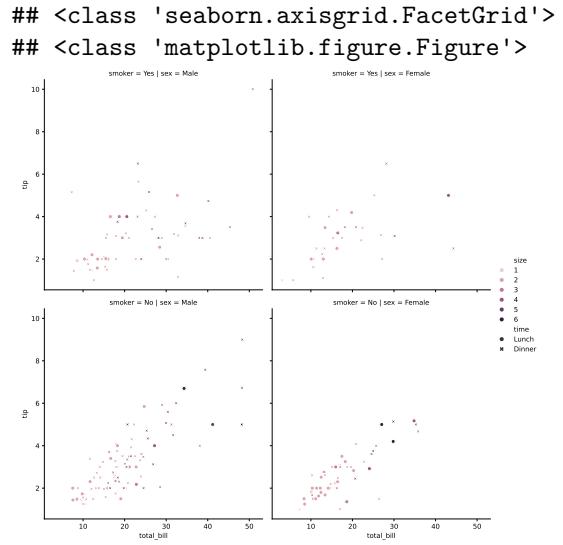

27.1.3.4 accessing figure and axes objects

Recall that Seaborn uses Matplotlib to draw the graphics. So underneath the Seaborn library, you can still access Matplotlib's figure object and axes objects if necessary. The call to figure-level plot returns an object.

```
import seaborn as sns

tips = sns.load_dataset("tips")
g = sns.relplot(kind='scatter',
                 data=tips,
                 x='total_bill',
                 y='tip',
                 style='time',
                 hue='size',
                 row='smoker',
                 col='sex')

print(type(g))
print(type(g.fig)) # g.fig gets you
                    ← the Figure
g.fig
```

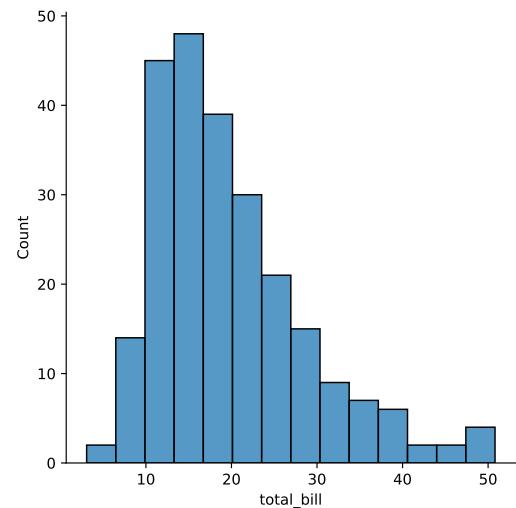

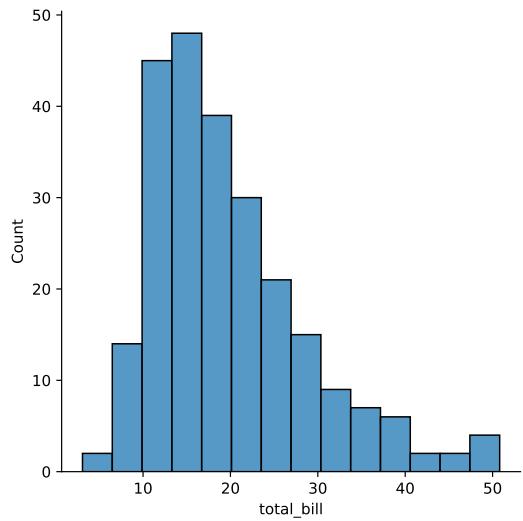

27.1.3.5 distribution plot

```
sns.displot
```

import seaborn as sns

tips = sns.load_dataset("tips")
sns.displot(kind='hist',
            data=tips,
            x='total_bill')
```

```
import seaborn as sns

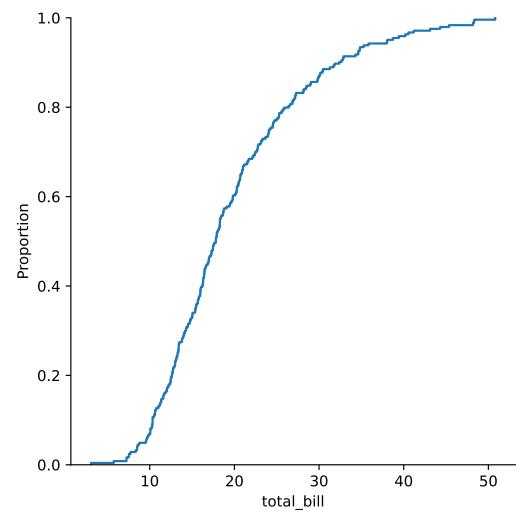

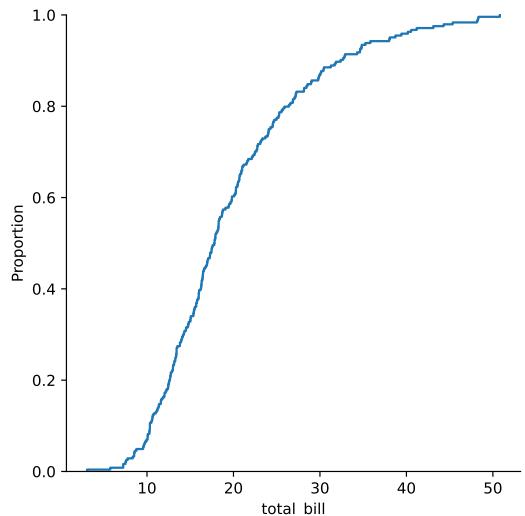

tips = sns.load_dataset("tips")
sns.displot(kind='hist', bins=20,
            data=tips,
            x='total_bill')
```

27.1.3.5.2 ECDF = empirical cumulative distrutive function

```
import seaborn as sns

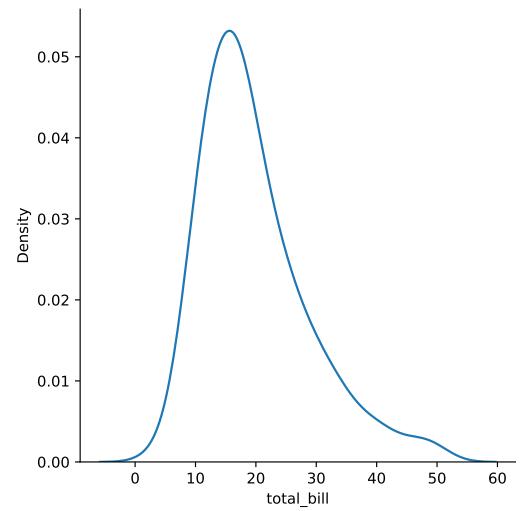

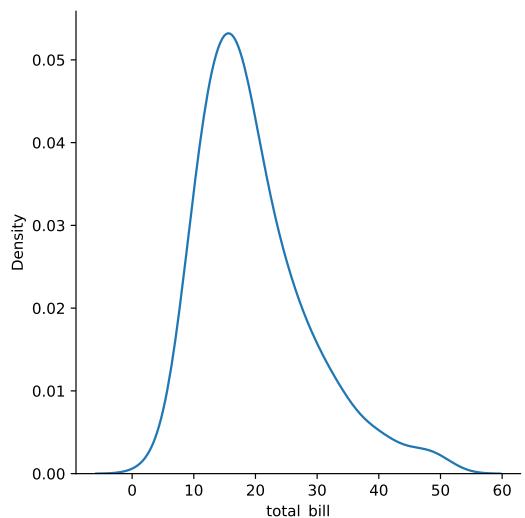

tips = sns.load_dataset("tips")
sns.displot(kind='ecdf',
            data=tips,
            x='total_bill')
```

27.1.3.5.3 KDE = kernel density estimation

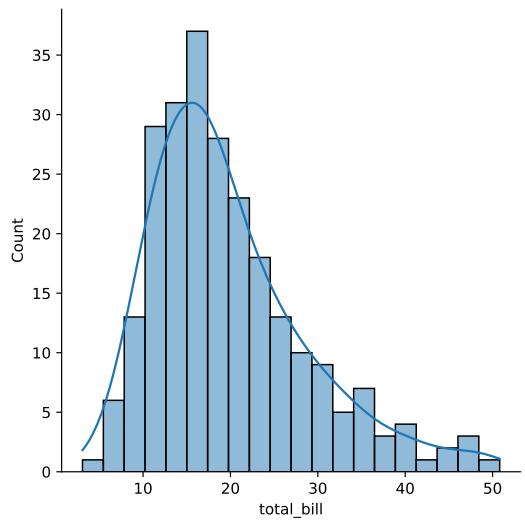

```
import seaborn as sns

tips = sns.load_dataset("tips")
sns.displot(kind='kde',
            data=tips,

```
import seaborn as sns

'% This file was created with tikzplotlib'

TikZ / `tikzpicture` with PGFplots `axis` by transforming Matplotlib-based Seaborn plot to .tex via Python package `tikzplotlib`

`xlabel={total_bill}`, changed to `xlabel={total bill}`, without `_` in text

`X ylabel={Count}`, changed to `ylabel={Count}`,: not necessary to be changed, the problem is `_` in xlabel name

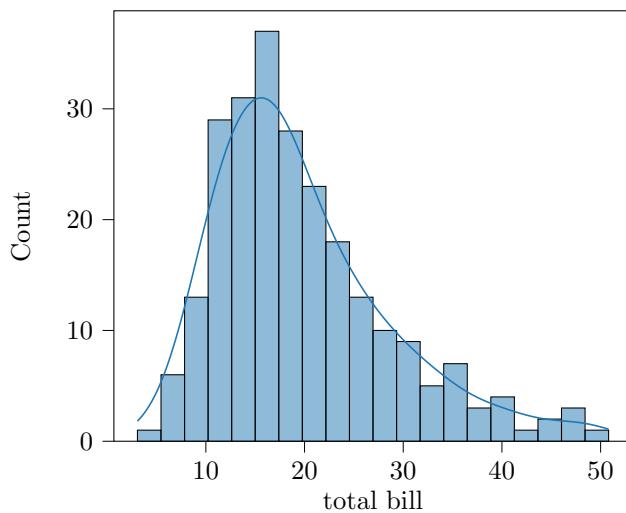

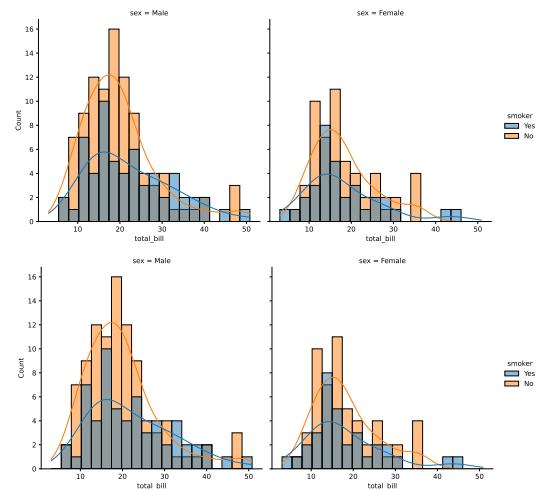

Figure 27.5: tikzplotlib

```
import seaborn as sns

tips = sns.load_dataset("tips")
sns.displot(kind='hist', bins=20,
            kde=True,
            data=tips,
            x='total_bill',
            hue='smoker',
            col='sex'
            )
```

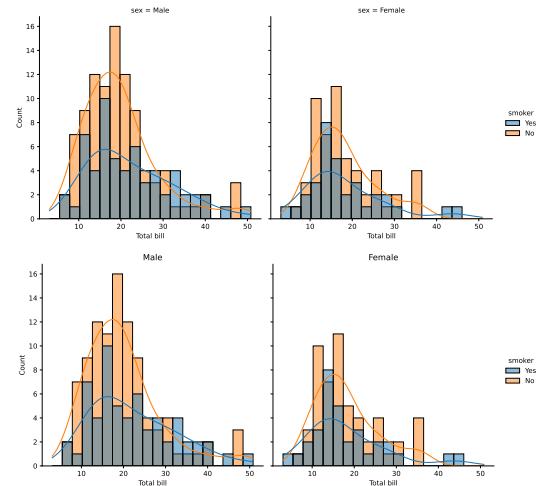

Let's customize the label and title.

```

import seaborn as sns

tips = sns.load_dataset("tips")
g = sns.displot(kind='hist', bins=20,
                 kde=True,
                 data=tips,

geom_point

smoothed conditional means https://ggplot2.tidyverse.org/reference/geom_smooth.html?q=geom_sm#null

Aids the eye in seeing patterns in the presence of overplotting. `geom_smooth()` and `stat_smooth()` are effectively aliases: they both use the same arguments. Use `stat_smooth()` if you want to display the results with a non-standard geom.

geom_smooth

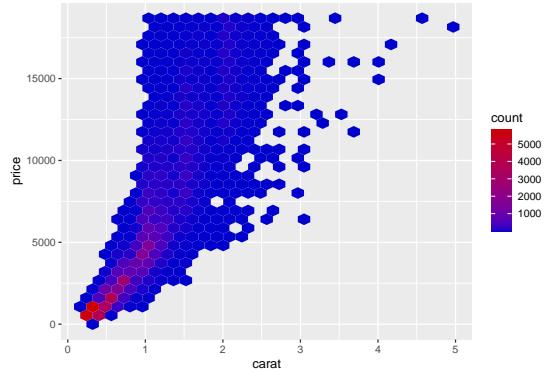

stat_smooth

`method` Smoothing method (function) to use, accepts either NULL or a character vector, e.g. "lm", "glm", "gam", "loess" or a function, e.g. MASS::rlm or mgcv::gam, `stats::lm`, or `stats::loess`. "auto" is also accepted for backwards compatibility. It is equivalent to NULL.

```

plot <https://www.rdocumentation.org/packages/graphics/versions/3.6.2/topics/plot.default>

pch a vector of **plotting characters** or symbols: see **points**.

col The **colors** for lines and points. Multiple colors can be specified so that each point can be given its own color. If there are fewer colors than points they are recycled in the standard fashion. Lines will all be plotted in the first colour specified.

panel.first an ‘expression’ to be evaluated after the plot axes are set up but before any plotting takes place. This can be useful for drawing **background grids** or **scatterplot smooths**. Note that this works by lazy evaluation: passing this argument from other plot methods may well not work since it may be evaluated too early.

legend <https://www.rdocumentation.org/packages/graphics/versions/3.6.2/topics/legend>

bty the **type of box** to be drawn around the legend. The allowed values are “o” (the default) and “n”.

<https://stackoverflow.com/questions/10108073/plot-legends-without-border-and-with-white-background>

Use option **bty = "n"** in legend to remove the box around the legend.

 - experimental unit
 - * response
 - * block: group of similar experimental unit (¹⁰ p.74)
 - observational unit / measurement unit ¹
- replication (⁹ p.76): an independent observation of the treatment (¹⁰ p.74)
 - treatment replication: experimental-unit-to-experimental-unit variation
 - measurement replication = subsample: measurement-to-measurement variation
- replicate
 - experimental replicate
 - biological replicate
 - technical replicate

¹⁰ p.73

Y_{ij} : the response observed from the j^{th} experimental unit assigned to the i^{th} treatment

μ_i : the mean response to the i^{th} treatment

ε_{ij} : the noise from other possible natural variation or nonrandom and random error

¹<https://passel2.unl.edu/view/lesson/2e09f0055f13/6>

$$Y_{ij} = \mu_i + \varepsilon_{ij}, \begin{cases} i \in \mathbb{N} \cap [1, n_i] & \mathbb{N} \ni n_i \text{ treatments} \\ j \in \mathbb{N} \cap [1, n_j] & \mathbb{N} \ni n_j \text{ experimental units per treatment} \end{cases}$$

Each treatment has n_j experimental units, so there are totally $n_i n_j$ experimental units.

If experimental units cannot be homogeneous, we can try to

- stratify them
- group them, and measure group to group variation
- block them

here n_j blocks each with n_i experimental units where **each treatment occurs once in each block**

$$\begin{aligned} Y_{ij} &= \mu_i + \varepsilon_{ij} \\ &= \mu_i + b_j + \varepsilon_{ij}^*, \begin{cases} i \in \mathbb{N} \cap [1, n_i] & \mathbb{N} \ni n_i \text{ experimental units per block} \\ j \in \mathbb{N} \cap [1, n_j] & \mathbb{N} \ni n_j \text{ blocks} \end{cases} \end{aligned}$$

where

$$\varepsilon_{ij} = b_j + \varepsilon_{ij}^*$$

i.e. the variation between groups or blocks of experimental units has been identified and isolated from ε_{ij}^* , which represents the variability of experimental units within a block. By isolating the block effect from the experimental units, the within-block variation can be used to compare treatment effects, which involves computing the estimated standard errors of contrasts of the treatments.

$$\begin{aligned} Y_{ij} - Y_{i'j} &= (\mu_i + b_j + \varepsilon_{ij}^*) \\ &\quad - (\mu_{i'} + b_j + \varepsilon_{i'j}^*) \\ &= (\mu_i - \mu_{i'}) + (\varepsilon_{ij}^* - \varepsilon_{i'j}^*) \end{aligned}$$

which does not depend on the block effect b_j or free of block effects. The result of this difference is that the variance of the difference of two treatment responses within a block depends on the within-block variation among the experimental units and not the between-block variation.

32.2.1 replication vs. subsample

It is very important to distinguish between a **subsample** and a **replication** since the error variance estimated from between subsamples is in general considerably smaller than the error variance estimated from replications or between experimental units. (¹⁰ p.77)

Chapter 33

quine

```
s = 's = %r\nprint(s%%s)'  
print(s%s)
```

```
## s = 's = %r\nprint(s%%s)'  
## print(s%s)
```

This snippet is a clever example of a quine. A quine is a computer program that takes no input and produces a copy of its own source code as its output. The given code in Python is written to print its own source when executed. Let's break it down:

`s = 's = %r\nprint(s%%s)':` This line defines a string `s` that contains a format string. `%r` is a placeholder that gets replaced with the `repr()` of the argument provided to the `%` operator, which in this case will be the string `s` itself. This means it will insert the string representation of `s` into the format string at `%r`.

`print(s%s):` This line prints the result of `s%s`. Here, the `%` operator is used to format the string `s` with itself. The `%s` inside the print statement is replaced by the string `s`, leading to the entire string being printed out, including the print statement itself.

This is because the format operation replaces `%r` with the representation of the string `s`, and `%%` is a way to escape the `%` sign in format strings, resulting in a single `%` in the output. This output is exactly the same as the source code, making it a quine.

33.1 `%r`

The `%r` in Python string formatting represents the “representation” of a value, which is typically the way you would see it if you were to type it into a Python interpreter. It uses the `repr()` function to convert the value to a string. This is useful for debugging, among other things, because it shows strings with quotes around them and escapes special characters. Essentially, `%r` gives you the “developer’s view” of what a variable looks like.

Here's a simple example to illustrate `%r` versus `%s` in string formatting:

```
my_str = "Hello, World!\nNew line character is represented with \\n"  
print("Using %%s: %s" % my_str)
```

```
## Using %s: Hello, World!  
## New line character is represented with \n
```

```
print("Using %%r: %r" % my_str)

## Using %r: 'Hello, World!\nNew line character is represented with \\n'
```

In this example:

The `%s` specifier tells Python to convert the object using `str()`, which is designed to be readable and outputs the string "Hello, World!\nNew line character is represented with \n", interpreting the escape character `\n` as a newline.

The `%r` specifier tells Python to convert the object using `repr()`, which aims to generate output that could be used to recreate the object, outputting the string 'Hello, World!\nNew line character is represented with \\n', preserving the actual escape characters in the output.

Notice how `%r` preserves the string exactly as it is, including the quotes and escaped characters, making it clear it's a string and showing the escape sequence explicitly.

39.4 definition of linear functional

functionals generalized to general vector space

$$f = \{f_i | f_i : V \rightarrow F\}$$

linear functionals generalized to general vector space is a linear transformation

$$f = \left\{ f_i \left| \begin{array}{l} f_i : V \rightarrow F \\ \forall \langle \mathbf{x}, \mathbf{y} \rangle \in V^2 [f_i(\mathbf{x} + \mathbf{y}) = f_i(\mathbf{x}) + f_i(\mathbf{y})] \\ \forall \mathbf{x} \in V, c \in F [f_i(c\mathbf{x}) = cf_i(\mathbf{x})] \end{array} \right. \right\}$$

$$f = \left\{ f_i \left| \begin{array}{l} f_i : V \rightarrow F \\ \forall \mathbf{x}, \mathbf{y} \in V [f_i(\mathbf{x} + \mathbf{y}) = f_i(\mathbf{x}) + f_i(\mathbf{y})] \\ \forall \mathbf{x} \in V, c \in F [f_i(c\mathbf{x}) = cf_i(\mathbf{x})] \end{array} \right. \right\}$$

vector space^[40]

<https://math.stackexchange.com/questions/2381942/the-set-of-all-linear-maps-tv-w-is-a-vector-space>

$$T : V \rightarrow W \Leftrightarrow \forall \mathbf{v} \in V, \exists! \mathbf{w} \in W [\mathbf{w} = T(\mathbf{v})]$$

$$\left\{ \begin{array}{l} V, W \text{ are vector spaces} \\ T : V \rightarrow W \\ \left\{ \begin{array}{l} \forall \mathbf{u}, \mathbf{v} \in V [T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})] \\ \forall \mathbf{v} \in V, c \in F [T(c\mathbf{v}) = cT(\mathbf{v})] \end{array} \right. \end{array} \right. \quad \text{linearity}$$

$\Leftrightarrow T$ is a linear transformation

$$\left\{ \begin{array}{l} V, W \text{ are vector spaces, both over } F \\ T, U : V \rightarrow W \\ \left\{ \begin{array}{l} T : V \rightarrow W \\ U : V \rightarrow W \end{array} \right. \\ T, U \text{ are both linear transformations} \\ \mathbf{v} \in V \\ c \in F \end{array} \right.$$

There is still linearity over linear transformations

(va)

$$\begin{aligned} (T + U)(\mathbf{u} + \mathbf{v}) &= T(\mathbf{u} + \mathbf{v}) + U(\mathbf{u} + \mathbf{v}) \\ &= [T(\mathbf{u}) + T(\mathbf{v})] + [U(\mathbf{u}) + U(\mathbf{v})] \\ &= [T(\mathbf{u}) + U(\mathbf{u})] + [T(\mathbf{v}) + U(\mathbf{v})] \\ &= (T + U)(\mathbf{u}) + (T + U)(\mathbf{v}) \end{aligned}$$

(sm)

$$\begin{aligned} (T + U)(c\mathbf{v}) &= T(c\mathbf{v}) + U(c\mathbf{v}) \\ &= cT(\mathbf{v}) + cU(\mathbf{v}) \\ &= c[T(\mathbf{v}) + U(\mathbf{v})] \\ &= c(T + U)(\mathbf{v}) \end{aligned}$$

so we can define

$$\left\{ \begin{array}{ll} (T + U)(\mathbf{v}) = T(\mathbf{v}) + U(\mathbf{v}) & \text{linear transformation addition} \\ (cT)(\mathbf{v}) = cT(\mathbf{v}) & \text{scalar linear transformation multiplication} \end{array} \right.$$

$\Leftrightarrow \mathcal{T} = \mathcal{T}(F, +, \cdot) = (\mathcal{T}, F, +, \cdot)$ is a vector space over the field F

$\Leftrightarrow \mathcal{T}$ is a vector space

Selected proofs of 8 vector space axioms due to some trivial field and vector space properties:

(va) (a)

$$\begin{aligned}
 (S + (T + U))(\mathbf{v}) &= S(\mathbf{v}) + (T + U)(\mathbf{v}) \\
 &= S(\mathbf{v}) + T(\mathbf{v}) + U(\mathbf{v}) \\
 &= (S + T)(\mathbf{v}) + U(\mathbf{v}) \\
 &= ((S + T) + U)(\mathbf{v})
 \end{aligned}$$

(va) (c)

$$\begin{aligned}
 (T + U)(\mathbf{v}) &= T(\mathbf{v}) + U(\mathbf{v}) \\
 &= U(\mathbf{v}) + T(\mathbf{v}) \\
 &= (U + T)(\mathbf{v})
 \end{aligned}$$

(va) (e)

$$O(\mathbf{v}) = 0\mathbf{w} \in W$$

$$\begin{aligned}
 (O + T)(\mathbf{v}) &= O(\mathbf{v}) + T(\mathbf{v}) \\
 &= 0\mathbf{w} + T(\mathbf{v}) \\
 &= T(\mathbf{v})
 \end{aligned}$$

$$O_1(\mathbf{v}) - O_2(\mathbf{v}) = 0\mathbf{w} - 0\mathbf{w} = 0\mathbf{w} \Rightarrow O_1(\mathbf{v}) = O_2(\mathbf{v})$$

(sm) (dv)

$$\begin{aligned}
 (c(T+U))(\mathbf{v}) &= c(T+U)(\mathbf{v}) \\
 &= c[T(\mathbf{v}) + U(\mathbf{v})] \\
 &= cT(\mathbf{v}) + cU(\mathbf{v}) \\
 &= (cT + cU)(\mathbf{v})
 \end{aligned}$$

40.1 What is a vector?

What is a vector? or What is an element in a vector space?

Binary operations defined on a vector space satisfying some properties is more important than what is a vector.

ultimate answer: double dual concept^[40.4.1.2]

In measure theory, we can define the distance of two functions by

$$d(f, g) = \sqrt{\int_{-\infty}^{\infty} [f(x) - g(x)]^2 dx}$$

for real distance of two square delta function approximations,

$$\begin{aligned} d(\delta_m, \delta_n) &= \sqrt{\int_{-\infty}^{\infty} [\delta_m(x) - \delta_n(x)]^2 dx} \\ &= \sqrt{\int_{-\infty}^{\infty} [\delta_m(x)]^2 - 2\delta_m(x)\delta_n(x) + [\delta_n(x)]^2 dx} \\ &= \sqrt{\int_{-\infty}^{\infty} [\delta_m(x)]^2 dx - 2 \int_{-\infty}^{\infty} \delta_m(x)\delta_n(x) dx + \int_{-\infty}^{\infty} [\delta_n(x)]^2 dx} \\ &= \sqrt{\int_{-\infty}^{\infty} \delta_m(x)\delta_m(x) dx - 2 \int_{-\infty}^{\infty} \delta_m(x)\delta_n(x) dx + \int_{-\infty}^{\infty} \delta_n(x)\delta_n(x) dx} \\ &= \sqrt{\delta_m(\xi_m) - 2 \int_{-\infty}^{\infty} \delta_m(x)\delta_n(x) dx + \delta_n(\xi_n)}, \begin{cases} \xi_m \in \left(\frac{-1}{2m}, \frac{1}{2m}\right) \\ \xi_n \in \left(\frac{-1}{2n}, \frac{1}{2n}\right) \end{cases} \\ &= \sqrt{m - 2 \int_{-\infty}^{\infty} \delta_m(x)\delta_n(x) dx + n}, \text{ if } m > n \\ &= \sqrt{m - 2\delta_n(\xi_n) + n}, \xi_n \in \left(\frac{-1}{2n}, \frac{1}{2n}\right) \\ &= \sqrt{m - 2n + n} = \sqrt{m - n} \in \mathbb{R} \\ d(\delta_m, \delta_n) &\stackrel{m \geq n}{=} \sqrt{m - n} \in \mathbb{R} \end{aligned}$$

Quantum mechanics is founded on Hilbert space; However, Dirac delta function is not a linear functional in Hilbert space?

One of the reason is that we cannot find 1-1 of Dirac delta function, but many-to-one or one-to-many functions.

量子力学本不需 Dirac delta function, 其 却仍大行其道, 實 廣義函數 為其負重前行.

Chapter 56

multivariate normal distribution

Definition 56.1. probability density function (PDF) of normal distribution (= Gaussian distribution)

$$\mathcal{N}(x | \mu, \sigma^2) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left\{-\frac{(x-\mu)^2}{2\sigma^2}\right\}$$

If a continuous random variable X follows a normal distribution with mean 0 and variance σ^2

$$\begin{aligned} X &\sim n(\mu, \sigma^2) = \mathcal{N}(\mu, \sigma^2) \\ \Leftrightarrow f_X(x) &= \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} = \frac{e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}}{\sigma\sqrt{2\pi}} = n(x | \mu, \sigma^2) \\ &= \frac{1}{\sqrt{2\pi}\sigma} \exp\left\{-\frac{(x-\mu)^2}{2\sigma^2}\right\} = \mathcal{N}(x | \mu, \sigma^2) \end{aligned}$$

A random variable X can be standardized by subtracting the mean μ and dividing by the standard deviation σ , resulting in the standardized random variable Z

$$Z = \frac{X - \mu}{\sigma} \text{ or } z = \frac{x - \mu}{\sigma}$$

The standardized random variable Z follows the standard normal distribution

$$\begin{aligned} Z &\sim n(0, 1^2) = \mathcal{N}(0, 1^2) \\ \Leftrightarrow f_Z(z) &= \frac{e^{-\frac{1}{2}\left(\frac{z-0}{1}\right)^2}}{1 \cdot \sqrt{2\pi}} = \frac{1}{\sqrt{2\pi}} \exp\left\{-\frac{z^2}{2}\right\} \\ &= n(z | 0, 1^2) = \mathcal{N}(z | 0, 1^2) \end{aligned}$$

To generalize from univariate random variables to multivariate random vectors, a random vector¹⁴

$$\mathbf{Z} = \langle Z_1, Z_2, \dots, Z_p \rangle = [Z_1 \ Z_2 \ \dots \ Z_p]^\top = \begin{bmatrix} Z_1 \\ Z_2 \\ \vdots \\ Z_p \end{bmatrix}$$

with p random variable components is said to follow the standard multivariate normal distribution if and only if its joint PDF is given by

$$f_{\mathbf{Z}}(\mathbf{z}) = \frac{1}{(2\pi)^{p/2}} \exp \left\{ -\frac{\mathbf{z}^T \mathbf{z}}{2} \right\} = \frac{1}{(2\pi)^{p/2}} \exp \left\{ -\frac{\mathbf{z} \cdot \mathbf{z}}{2} \right\} \quad (56.1)$$

(56.1) can be rewritten as the following

$$\begin{aligned} f_{\mathbf{Z}}(\mathbf{z}) &= \underbrace{\frac{1}{\sqrt{2\pi}} \frac{1}{\sqrt{2\pi}} \cdots \frac{1}{\sqrt{2\pi}}}_{p \text{ times}} \exp \left\{ -\frac{z_1^2}{2} - \frac{z_2^2}{2} - \cdots - \frac{z_p^2}{2} \right\} \\ &= \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{z_1^2}{2} \right\} \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{z_2^2}{2} \right\} \cdots \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{z_p^2}{2} \right\} \\ &= f(z_1) f(z_2) \cdots f(z_p) \end{aligned}$$

where

$$f_{Z_i}(z_i) = \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{z_i^2}{2} \right\} = f(z_i) \Rightarrow Z_i \sim \mathcal{N}(0, 1^2) = \text{n}(0, 1^2) \quad (56.2)$$

$$\begin{aligned} f_{Z_i}(z_i) &= \int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty} f_{\mathbf{Z}}(z_1, \dots, z_{i-1}, z_i, z_{i+1}, \dots, z_p) dz_1 \cdots dz_{i-1} dz_{i+1} \cdots dz_p \\ &= \int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty} f(z_1) \cdots f(z_{i-1}) f(z_i) f(z_{i+1}) \cdots f(z_p) dz_1 \cdots dz_{i-1} dz_{i+1} \cdots dz_p \\ &= f(z_i) \int_{-\infty}^{\infty} f(z_1) dz_1 \cdots \int_{-\infty}^{\infty} f(z_{i-1}) dz_{i-1} \int_{-\infty}^{\infty} f(z_{i+1}) dz_{i+1} \cdots \int_{-\infty}^{\infty} f(z_p) dz_p \\ &= f(z_i) \stackrel{(56.2)}{=} \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{z_i^2}{2} \right\} \end{aligned}$$

Consider two infinitesimal volumes of p -dimensional parallelepipeds in the different \mathbb{R}^p spaces¹⁵

$$V_{\mathbf{x}} = [x_1, x_1 + dx_1] \times [x_2, x_2 + dx_2] \times \cdots \times [x_p, x_p + dx_p]$$

and

$$V_{\mathbf{z}} = [z_1, z_1 + dz_1] \times [z_2, z_2 + dz_2] \times \cdots \times [z_p, z_p + dz_p]$$

Their relationship under linear transformation is

$$\begin{aligned} V_{\mathbf{x}} = T(V_{\mathbf{z}}) &= [T(z_1), T(z_1) + T(dz_1)] \\ &\quad \times [T(z_2), T(z_2) + T(dz_2)] \\ &\quad \times \dots \\ &\quad \times [T(z_p), T(z_p) + T(dz_p)] \end{aligned}$$

and

$$dx_i = \sum_j \frac{\partial x_i}{\partial z_j} dz_j$$

For examples in 2 dimension,

$$\begin{bmatrix} dx_1 \\ dx_2 \end{bmatrix} = \begin{bmatrix} \frac{\partial x_1}{\partial z_1} & \frac{\partial x_1}{\partial z_2} \\ \frac{\partial x_2}{\partial z_1} & \frac{\partial x_2}{\partial z_2} \end{bmatrix} \begin{bmatrix} dz_1 \\ dz_2 \end{bmatrix}$$

Two element infinitesimal one-directional vectors of \mathbf{Z} transformed into another space of \mathbf{X} are

$$T(dz_1) = \begin{bmatrix} \frac{\partial x_1}{\partial z_1} & \frac{\partial x_1}{\partial z_2} \\ \frac{\partial x_2}{\partial z_1} & \frac{\partial x_2}{\partial z_2} \end{bmatrix} \begin{bmatrix} dz_1 \\ 0 \end{bmatrix} = \begin{bmatrix} \frac{\partial x_1}{\partial z_1} dz_1 \\ \frac{\partial x_2}{\partial z_1} dz_1 \end{bmatrix}$$

and

$$T(dz_2) = \begin{bmatrix} \frac{\partial x_1}{\partial z_1} & \frac{\partial x_1}{\partial z_2} \\ \frac{\partial x_2}{\partial z_2} & \frac{\partial x_2}{\partial z_2} \end{bmatrix} \begin{bmatrix} 0 \\ dz_2 \end{bmatrix} = \begin{bmatrix} \frac{\partial x_1}{\partial z_2} dz_2 \\ \frac{\partial x_2}{\partial z_2} dz_2 \end{bmatrix}$$

Their corresponding area(volume) in the space of \mathbf{X} is

$$\begin{aligned} \int_{A_{\mathbf{x}}} dA_{\mathbf{x}} &= \int_{A_{\mathbf{x}}} dx_1 dx_2 = \int_{T(A_{\mathbf{z}})} dx_1 dx_2 \\ &= \int_{A_{\mathbf{z}}} |[T(dz_1) \quad T(dz_2)]| = \int_{A_{\mathbf{z}}} \left| \begin{array}{cc} \frac{\partial x_1}{\partial z_1} dz_1 & \frac{\partial x_1}{\partial z_2} dz_2 \\ \frac{\partial x_2}{\partial z_1} dz_1 & \frac{\partial x_2}{\partial z_2} dz_2 \end{array} \right| \\ &= \int_{A_{\mathbf{z}}} \left| \begin{array}{cc} \frac{\partial x_1}{\partial z_1} & \frac{\partial x_1}{\partial z_2} \\ \frac{\partial x_2}{\partial z_1} & \frac{\partial x_2}{\partial z_2} \end{array} \right| dz_1 dz_2 = \int_{A_{\mathbf{z}}} |J| dA_{\mathbf{z}} \end{aligned}$$

To generalize for volumes in p dimension,

$$\begin{aligned}
\int_{V_x} dV_x &= \int_{V_x} dx_1 dx_2 \cdots dx_p = \int_{T(V_z)} dx_1 dx_2 \cdots dx_p \\
&= \int_{A_z} \left| \begin{bmatrix} T(dx_1) & T(dx_2) & \cdots & T(dx_p) \end{bmatrix} \right| = \int_{V_z} \left| \begin{bmatrix} \frac{\partial x_i}{\partial z_j} dz_j \end{bmatrix}_{p \times p} \right| \\
&= \int_{V_z} \left| \begin{bmatrix} \frac{\partial x_i}{\partial z_j} \end{bmatrix}_{p \times p} \right| dz_1 dz_2 \cdots dz_p = \int_{V_z} |J| dV_z
\end{aligned}$$

i.e.

$$\int_{V_x} dV_x = \int_{V_z} |J| dV_z \quad (56.12)$$

where J is a Jacobian matrix

$$J = \left[\frac{\partial x_i}{\partial z_j} \right]_{p \times p} = \frac{\partial \mathbf{x}}{\partial \mathbf{z}}$$

or $|J|$ is a Jacobian determinant or simply Jacobian

$$|J| = \left| \frac{\partial x_i}{\partial z_j} \right|_{p \times p} = \left| \frac{\partial \mathbf{x}}{\partial \mathbf{z}} \right|$$

The probability of the same event should be invariant under transformation.

$$\begin{aligned}
\int_{V_x} f_{\mathbf{X}}(\mathbf{x}) dV_x &= \int_{V_x} f_{\mathbf{X}}(\mathbf{x}) dx_1 dx_2 \cdots dx_p \\

$$\Sigma = \begin{bmatrix} \gamma_0 & \gamma_1 & \cdots & \gamma_{T-1} \\ \gamma_1 & \gamma_0 & \cdots & \gamma_{T-2} \\ \vdots & \vdots & \ddots & \vdots \\ \gamma_{T-1} & \gamma_{T-2} & \cdots & \gamma_0 \end{bmatrix} = \sigma^2 \begin{bmatrix} 1 & \rho & \rho^2 & \cdots & \rho^{T-1} \\ \rho & 1 & \rho & \cdots & \rho^{T-2} \\ \rho^2 & \rho & 1 & \cdots & \rho^{T-3} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \rho^{T-1} & \rho^{T-2} & \rho^{T-3} & \cdots & 1 \end{bmatrix}$$

60.2 $AR(2) = 2^{\text{nd}}\text{-order autoregressive model} = \text{second-order autoregressive model}$

Definition 60.6. $AR(2) = 2^{\text{nd}}$ -order autoregressive model

$$Y_t = \beta_0 + \beta_1 Y_{t-1} + \beta_2 Y_{t-2} + \varepsilon_t$$

$$\varepsilon_t \sim \mathcal{N}(0, \sigma_{\varepsilon}^2)$$

60.3 AR(p) = p^{th} -order autoregressive model

$$Y_t = \beta_0 + \sum_{i=1}^p \beta_i Y_{t-i} + \varepsilon_t$$

60.4 MA(q) = q^{th} -order moving-average model

$$Y_t = \mu + \varepsilon_t + \sum_{i=1}^q \alpha_i \varepsilon_{t-i}$$

60.5 ARMA(p,q) = $p^{\text{th}}, q^{\text{th}}$ -order autoregressive-moving-average model

$$Y_t = \varepsilon_t + \sum_{i=1}^q \alpha_i \varepsilon_{t-i} + \sum_{i=1}^p \beta_i Y_{t-i}$$
